PROJECT REPORT: Emoji-Based Music Player

Title:

Emoji-Based Music Player using Python

Objective:

The objective of this project is to create a simple Python-based application that detects a user's emotion through emojis and plays a corresponding song using a web browser.

Introduction:

In today's digital world, emojis are widely used to express emotions. This project leverages emojis as input to identify the user's mood and automatically play a song that matches that emotion. It combines basic Python concepts with real-world applications like web automation.

Tools & Technologies Used:

- **Programming Language:** Python
- **Module Used:** webbrowser
- **Platform:** Any system with Python installed
- **Input Method:** User input (emoji)

Working Principle:

1. The user inputs an emoji.
2. The program checks which emotion the emoji belongs to.
3. Once the emotion is detected:
    - It prints the detected emotion.
    - It fetches the corresponding song link.
    - Opens the song in the web browser.
4. If the emoji is not found, an error message is displayed.

Code Explanation:

- A dictionary maps **emotion to emojis**
- Another dictionary maps **emotions to songs**
- A loop is used to match the entered emoji with the list
- If matched:
    - Emotion is identified
    - Song is played using webbrowser.open()

Features:

- Simple and user-friendly
- Real-time emotion detection using emojis
- Automatic song playback
- Covers multiple emotions like happy, sad, angry, love, etc.

Advantages:

- Easy to understand and implement
- Interactive and fun
- Demonstrates practical use of Python
- Can be expanded into advanced applications

Limitations:

- Limited emoji database
- Requires internet connection
- Only one song per emotion

Conclusion:

This project successfully demonstrates how emojis can be used as an input method to detect emotions and automate actions like playing music. It is a creative and beginner-friendly project combining logic, dictionaries, and real-world application.
